

XG BOOST ALGORITHM

XG BOOSTING

- ▶ Stands for:
 - ▶ eXtreme Gradient Boosting.
- ▶ XGBoost is a powerful iterative learning algorithm based on gradient boosting.

PROCESS

- Step 1:** The algorithm makes an initial prediction - the average value of the target column.
- Step 2:** It calculates the **residuals** (the gap between actual values and initial predictions).
- Step 3:** A new decision tree is trained to predict these residuals and correct the mistakes made by the previous tree.
